# Preface

This document set provides a complete specification for the [Extensible Metadata Platform \(XMP\)](#), which provides a standard format for the creation, processing, and interchange of metadata, for a wide variety of applications.

The specification has three parts:

- *Part 1, Data Model, Serialization, and Core Properties*, covers the basic metadata representation model that is the foundation of the XMP standard format. The data model prescribes how XMP metadata can be organized; it is independent of file format or specific usage. The serialization information prescribes how the data model is represented in XML, specifically RDF/XML. Core properties are those XMP properties that have general applicability across a broad range of resources; these include general-purpose namespaces such as Dublin Core. This document also provides details needed to implement a metadata manipulation system such as the XMP Toolkit (which is available from Adobe®).
- *Part 2, Additional Properties*, provides detailed property lists and descriptions for standard XMP metadata namespaces beyond the core properties; these include special-purpose namespaces for Adobe applications such as Photoshop®. It also provides information on extending existing namespaces and creating new namespaces.
- *Part 3, Storage in Files*, provides information about how serialized XMP metadata is packaged into XMP Packets and embedded in different file formats. It includes information about how XMP relates to and incorporates other metadata formats, and how to reconcile values that are represented in multiple metadata formats.

## About this document

This document, *XMP Specification Part 2, Additional Properties*, is intended for developers of applications that will generate, process, or manage files containing XMP metadata. Such developers may use either the XMP Toolkit provided by Adobe, or independent implementations.

Previously-defined formats (*native formats*) for still-image metadata, such as Exif and IPTC/TIFF, represent information that is also represented by properties defined in standard XMP namespaces. For information on how to reconcile property values among formats, and on how such reconciliation has been managed in Adobe applications, see *XMP Specification Part 3, Storage in Files*.

## How this document is organized

This document has the following sections:

- [1, “XMP namespaces”](#), explains how the namespace definitions are presented, and provides details of property value types. It also describes how you can extend existing namespaces or define new ones.
- [2, “XMP standard namespaces”](#), provides namespace definitions for standard general-purpose namespaces.
- [3, “Specialized Namespaces”](#), provides namespace definitions for namespaces that are specialized for Adobe applications or usages.

## Document history

This release of this document (December 2014) has changed in these ways since the previous release (April 2010):

- Changed the xmpDM:scale type to Rational in [Table 20 —, “Time fields”](#)
- Specified semicolon delimiter for 5994DropTimecode in [Table 21 —, “Timecode fields”](#)
- Updated 5994drop in the excluded formats for xmpDM:timeValue in [Table 21 —, “Timecode fields”](#)
- Changed the type of xmpTPg:Colorants to ordered array of Colorants in [Table 28 —, “Paged-text properties”](#)
- Changed the xmpDM:fileDataRate type to Rational in [Table 29 —, “XMP Dynamic Media properties”](#)

- Updated the description of xmpDM:scene to include number of scene in Table 29 —, “XMP Dynamic Media properties”
- Changed the xmpDM:videoAlphaPremultipleColor type to Rational in Table 29 —, “XMP Dynamic Media properties”
- Changed the xmpDM:videoFrameRate type to Real in Table 29 —, “XMP Dynamic Media properties”
- Changed the xmpDM:videoPixelAspectRatio type to Rational in Table 29 —, “XMP Dynamic Media properties”
- Added the definitions for the properties partOfCompilation, lyrics, discNumber in Table 29 —, “XMP Dynamic Media properties”

## Conventions used in this document

The following type styles are used for specific types of text:

**Table 1 — Conventions for type styles**

Typeface Style	Used for:
<b>bold</b>	XMP property names. For example, <b>xmp:CreateDate</b>
Monospaced Regular	XML code and other literal values, such as value types and names in other languages or formats

## Where to go for more information

See these sites for information on the Internet standards and recommendations on which XMP Metadata is based:

# 1 XMP namespaces

This chapter contains the following information:

- 1.1, “XMP namespace definitions”: An overview of namespace definitions and terminology.
- 1.2, “Property value types”: Definitions and explanations of property values used by the namespaces.
- 1.3, “Extensibility of namespaces”: Guidelines for creating custom XMP properties.

## 1.1 XMP namespace definitions

The namespaces define a set of properties. In any given XMP Packet, a property may be *absent* or *present*:

- Absent: The property has no value. Properties are absent until given a value for the first time.
- Present: The property has a defined value. A present property may have the empty string as its value; this is different from an absent property. However, writers are encouraged not to set properties with a value of the empty string.

For any given XMP, there is no requirement that all properties from a given namespace must be present. For structured properties, there is no requirement that all fields be present (unless otherwise specified by a namespace).

XMP metadata may include properties from one or more of the namespaces. For example, a typical subset used by many Adobe applications might include the following:

- Dublin Core namespace: **dc:title**, **dc:creator**, **dc:description**, **dc:subject**, **dc:format**, **dc:rights**
- XMP basic namespace: **xmp:CreateDate**, **xmp:CreatorTool**, **xmp:ModifyDate**, **xmp:MetadataDate**
- XMP rights management namespace: **xmpRights:WebStatement**, **xmpRights:Marked**
- XMP media management namespace: **xmpMM:DocumentID**

### 1.1.1 Included namespaces

The following namespaces definitions are included in this document:

- 2, “XMP standard namespaces”
  - 2.1, “XMP namespace”
  - 2.2, “XMP Media Management namespace”
  - 2.3, “XMP Basic Job Ticket namespace”
  - 2.4, “XMP Paged-text namespace”
  - 2.5, “XMP Dynamic Media namespace”
- 3, “Specialized Namespaces”
  - 3.1, “Adobe PDF namespace”
  - 3.2, “Photoshop namespace”
  - 3.3, “Camera Raw namespace”
  - 3.4, “Exif namespaces”

**NOTE** This document does not provide details of the IPTC namespace. For complete information on this namespace, see the IPTC Web site at <http://www.iptc.org/IPTC4XMP/>.

### 1.1.2 Namespace definition conventions

The namespace definitions in this document show the XML namespace URI that identifies the namespace, and a preferred namespace prefix, followed by a table that lists all properties defined for the namespace. Each table has the following columns:

- **Name** — the name of the property, including the preferred namespace prefix.
- **Type** — The value type of the property, with links to where each value type is described in [1.2, “Property value types”](#). Array types are preceded by the container type: ordered, unordered, or alternative; see *XMP Specification Part 1, Data Model, Serialization, and Core Properties* for details.
- **Description** — The description of the property.

Some XMP properties have been deprecated since earlier versions of the specification. They are defined here for compatibility purposes, but should not be used in the future.

Previous versions of this specification referred to *aliased* properties. Specific XMP implementations may treat a property in one namespace as equivalent to a property in another namespace. However, to foster interchange, applications must always write the standard, “base” form of the property. In this version of the specification, only the base properties are listed.

## 1.2 Property value types

The following sections list the value types used in the XMP namespaces. Note that value types used in the Exif namespace are listed with the Exif specification; see [3.4, “Exif namespaces”](#).

- [1.2.1, “Core value types”](#)
- [1.2.2, “Complex value types”](#)
- [1.2.3, “Media management value types”](#)
- [1.2.4, “ResourceEvent”](#)
- [1.2.5, “Basic job/workflow value types”](#)
- [1.2.6, “Video media value types”](#)

### 1.2.1 Core value types

Refer to *Part 1, Data Model, Serialization, and Core Properties*, for definitions of the following:

- AgentName
- Boolean
- Choice
- Date
- GUID
- Integer
- Language Alternative
- Locale
- MIMEType
- ProperName
- Real
- RenditionClass
- ResourceRef

- Text
- URI
- URL

## 1.2.2 Complex value types

### 1.2.2.1 Colorant

A structure containing the characteristics of a colorant (swatch) used in a document.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/g/>
- The preferred field namespace prefix is **xmpG**

**Table 3 — Colorant fields**

Name	Type	Description
<b>xmpG:A</b> <b>xmpG:B</b>	Integer	A or B value when the mode is LAB. Range -128 to 127.
<b>xmpG:L</b>	Real	L value when the mode is LAB. Range 0-100.
<b>xmpG:black</b> <b>xmpG:cyan</b> <b>xmpG:magenta</b> <b>xmpG:yellow</b>	Real	Colour value when the mode is CMYK. Range 0-100.
<b>xmpG:blue</b> <b>xmpG:green</b> <b>xmpG:red</b>	Integer	Colour value when the mode is RGB. Range 0-255.
<b>xmpG:mode</b>	closed Choice	The colour space in which the colour is defined. One of: CMYK, RGB, LAB. Library colours are represented in the colour space for which they are defined.
<b>xmpG:swatchName</b>	Text	Name of the swatch.
<b>xmpG:type</b>	closed Choice	The type of colour, one of PROCESS or SPOT.

### 1.2.2.2 Dimensions

A structure containing dimensions for a drawn object.

The field namespace URI is <http://ns.adobe.com/xap/1.0/sType/Dimensions#>

The preferred field namespace prefix is **stDim**

**Table 4 — Dimensions fields**

Name	Type	Description
<b>stDim:h</b> <b>stDim:w</b>	Real	Height and width magnitude.
<b>stDim:unit</b>	open Choice	Units. For example: inch, mm, pixel, pica, point

### 1.2.2.3 Font

A structure containing the characteristics of a font used in a document.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/sType/Font#>
- The preferred field namespace prefix is **stFnt**

**Table 5 — Fonts fields**

Name	Type	Description
<b>stFnt:childFontFiles</b>	ordered array of String	The list of file names for the fonts that make up a composite font.
<b>stFnt:composite</b>	Boolean	When true, this is a composite font.
<b>stFnt:fontFace</b>	Text	The font face name.
<b>stFnt:fontFamily</b>	Text	The font family name.
<b>stFnt:fontFileName</b>	String	The font file name (not a complete path).
<b>stFnt:fontName</b>	Text	PostScript® name of the font.
<b>stFnt:fontType</b>	open Choice	The font type, such as TrueType, Type 1, Open Type, and so on.
<b>stFnt:versionString</b>	String	<p>The version string:</p> <ul style="list-style-type: none"><li>• /version for Type1 fonts</li><li>• nameId 5 for Apple True Type and OpenType</li><li>• /CIDFontVersion for CID fonts</li><li>• The empty string for bitmap fonts</li></ul> <p>The Adobe CoolType font engine allows two fonts with the same PostScript name and different technologies to be used at the same time, but not if they are from different versions. So even without this data for a given document you will have unique font data. However, the version can tell you if the font has changed metrics, glyph forms or other important information. This is useful for comparing fonts in two documents or fonts in a document to those in your system.</p>

### 1.2.2.4 Thumbnail

A thumbnail image for a file.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/g/img/>
- The preferred field namespace prefix is **xmpGImg**

**Table 6 — Thumbnail fields**

Name	Type	Description
<b>xmpGImg:format</b>	Closed Choice	The image encoding. Defined value: JPEG.
<b>xmpGImg:height</b> <b>xmpGImg:width</b>	Integer	Height and width in pixels

**Table 6 — Thumbnail fields (Continued)**

Name	Type	Description
<b>xmpGImg:image</b>	Text	The full thumbnail image data, converted to base 64 notation (according to section 6.8 of RFC 2045). This is the thumbnail data typically found in a digital image, such as the value of tag 513 in a JPEG stream.

### 1.2.3 Media management value types

#### 1.2.3.1 Part

A Unicode string that identifies a portion of a resource. This is typically a general or logical portion, rather than a specific physical portion. For example, the metadata or the content, or the audio portion of a movie or the video portion.

Part names are a hierarchy of arbitrary depth, specified using path syntax where levels in the hierarchy shall be indicated by a slash ("/", U+002F). The slash shall not be used for any other purpose in these strings. The leftmost character shall be a slash. A path may be just a slash, indicating any or all parts.

All paths implicitly encompass further descendants. For example, "/content" includes all content, whereas "/content/audio" includes all audio but excludes other content such as "/content/video". The collection of part components is open. Additional levels of subparts or alternatives for existing levels may be used; for example, "/content/audio/channels/left" or "/content/audio/FFAudio/high". When such subparts are used, each subpart name shall be unique and signify a component that is disjoint from any of its siblings.

A part component name shall follow a restricted syntax of an XML Name as defined in *Extensible Markup Language*. At most one colon (":" U+003A) shall be used, and a colon shall not be the first character. Of the XML Name characters below U+0080, only "A" through "Z", "a" through "z", "0" through "9", and colon may be used. Other XML Name characters below U+0080 are reserved for future use. XMP readers should tolerate reserved characters, and should ignore the remainder of a path from the leftmost component containing a reserved character.

Table 7 lists part component names that are explicitly defined:

**Table 7 — Part component names**

Part specification	Part that changed or is referenced
/	Any (specific part unknown) or all (all parts of the content and metadata).
/metadata	Portions of the metadata.
/content	Any or all of the content (non-metadata).
/content/audio	Any or all sound.
/content/visual	Some image data (video or still).
/content/visual/video	Video or animation.
/content/visual/raster	Static raster image.
/content/visual/vector	Static vector image.
/content/visual/form/data	Form field data.
/content/visual/form/template	Form template.

Table 7 — Part component names (Continued)

Part specification	Part that changed or is referenced
/content/visual/annots	Applied annotations (comments).
[/]time:## [/]time:##d## [/]time:##r##	<p>A time, duration, or time range specifier. May be standalone (meaning all parts starting at the time or within the range specified) or may be added to any of the listed specifications.</p> <ul style="list-style-type: none"> <li>##: The start time, a frame count.</li> <li>##d##: Duration (start time and duration time)</li> <li>##r##: Range (start time and end time)</li> </ul> <p>Each ## value is a <a href="#">FrameCount</a> specifier, which can include an optional frame rate. The default frame rate is 1fps. The default duration is "maximum", the entire length of the asset.</p> <p>In a fromPart or toPart value, the leading / is optional. For an <b>stEvt:changed</b> part descriptor in a history record, the leading / is required.</p> <p>For a fromPart value, the start time is an offset from the start of the current ingredient's file. For a toPart value, the start time is measured from the start of the destination file. If time values are not specifically given, the default start time is 0, meaning the beginning of the relevant file.</p>

#### 1.2.4 ResourceEvent

A structure denoting a high-level event that occurred in the processing of a resource.

- The field namespace URI shall be "http://ns.adobe.com/xap/1.0/sType/ResourceEvent#".
- The preferred field namespace prefix is **stEvt**.

Table 8 lists the fields available in ResourceEvent. The structure shall include the **stEvt:action** and **stEvt:when** fields; other fields need not be present. The fields, if used, shall be of the specified types. The field content should be as described.

Table 8 — ResourceEvent fields

Name	Type	Definition
<b>stEvt:action</b>	Open Choice of Text	<p>The action that occurred. Defined values are: <code>converted</code>, <code>copied</code>, <code>created</code>, <code>cropped</code>, <code>edited</code>, <code>filtered</code>, <code>formatted</code>, <code>version_updated</code>, <code>printed</code>, <code>published</code>, <code>managed</code>, <code>produced</code>, <code>resized</code>, <code>saved</code>.</p> <p>New values should be verbs in the past tense.</p>
<b>stEvt:changed</b>	Text	<p>A semicolon-delimited list of the parts of the resource that were changed since the previous event history.</p> <p>If not present, presumed to be undefined. When tracking changes and the scope of the changed components is unknown, it should be assumed that anything might have changed.</p>
<b>stEvt:instanceID</b>	GUID	The value of the <b>xmpMM:InstanceID</b> property for the modified (output) resource.
<b>stEvt:parameters</b>	Text	Additional description of the action.
<b>stEvt:softwareAgent</b>	AgentName	The software agent that performed the action.

Table 8 — ResourceEvent fields (Continued)

Name	Type	Definition
<b>stEvt:when</b>	Date	Timestamp of when the action occurred. For events that create or write to a file, this should be the approximate modification time of the file.

#### 1.2.4.1 ResourceRef

A multiple part reference to a resource. Used to indicate prior versions, originals of renditions, originals for derived documents, and so on. The fields present in any specific reference depend on usage and on whether the referenced resource is managed. Except for instanceID, the fields are all properties from the referenced resource's xmpMM namespace.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/sType/ResourceRef#>
- The preferred field namespace prefix is **stRef**

Table 9 — ResourceRef fields

Name	Type	Description
<b>stRef:alternatePaths</b>	ordered array of URI	The referenced resource's fallback file paths or URLs. The sequence order is the recommended order in attempting to locate the resource.
<b>stRef:documentID</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>stRef:filePath</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>stRef:fromPart</b>	Part	For a resource within an <a href="#">xmpMM:Ingredients</a> list, the part of this resource that is incorporated in the containing document.
<b>stRef:instanceID</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>stRef:lastModifyDate</b>	Date	The value of <b>stEvt:when</b> for the last time the file was written.
<b>stRef:manager</b>	AgentName	The referenced resource's <a href="#">xmpMM:Manager</a> .
<b>stRef:managerVariant</b>	Text	The referenced resource's <a href="#">xmpMM:ManagerVariant</a> .
<b>stRef:manageTo</b>	URI	The referenced resource's <a href="#">xmpMM:ManageTo</a> .
<b>stRef:manageUI</b>	URI	The referenced resource's <a href="#">xmpMM:ManageUI</a> .
<b>stRef:maskMarkers</b>	closed Choice	For a resource within an <a href="#">xmpMM:Ingredients</a> list, whether markers in this resource should be ignored (masked) or processed normally. One of: All: Ignore markers in this ingredient and all its children. None: Process markers in this ingredient and all its children.
<b>stRef:partMapping</b>	Text	The name or URI of a mapping function used to map the fromPart to the toPart. The default for time mappings is "linear".
<b>stRef:renditionClass</b>	RenditionClass	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.

**Table 9 — ResourceRef fields (Continued)**

Name	Type	Description
<b>stRef:renditionParams</b>	Text	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>stRef:toPart</b>	<a href="#">Part</a>	For a resource within an <a href="#">xmpMM:Ingredients</a> list, the part of the containing document into which this resource is incorporated.
<b>stRef:versionID</b>	Text	The referenced resource's <a href="#">xmpMM:VersionID</a> .

#### 1.2.4.2 Version

Describes one version of a document.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/sType/Version#>
- The preferred field namespace prefix is **stVer**

**Table 10 — Version fields**

Name	Type	Description
<b>stVer:comments</b>	Text	Comments concerning what was changed.
<b>stVer:event</b>	<a href="#">ResourceEvent</a>	High-level, formal description of what operation the user performed.
<b>stVer:modifier</b>	ProperName	The person who modified this version.
<b>stVer:modifyDate</b>	Date	The date on which this version was checked in.
<b>stVer:version</b>	Text	The new version number.

#### 1.2.5 Basic job/workflow value types

The following value type is used for the Basic Job/Workflow namespace.

##### 1.2.5.1 Job

Describes a job for a job-management system.

- The field namespace URI is <http://ns.adobe.com/xap/1.0/sType/Job#>
- The preferred field namespace prefix is **stJob**

**Table 11 — Job fields**

Name	Type	Description
<b>stJob:id</b>	Text	Unique ID for the job. This field is a reference into some external job management system.
<b>stJob:name</b>	Text	Informal name of job. This name is for user display and informal systems.
<b>stJob:url</b>	URL	A file URL referencing an external job management file.

## 1.2.6 Video media value types

The following value types are used for the [XMP Dynamic Media namespace](#).

- The field namespace URI is <http://ns.adobe.com/xmp/1.0/DynamicMedia/>
- The preferred field namespace prefix is **xmpDM**

### 1.2.6.1 beatSpliceStretch

A set of parameters used when stretching audio using the Beat Splice stretch mode.

**Table 12 — beatSpliceStretch fields**

Name	Type	Description
<b>xmpDM:riseInDecibel</b>	Real	The amount sound must increase in amplitude to detect a beat.
<b>xmpDM:riseInTimeDuration</b>	<a href="#">Time</a>	The duration of the sampling window used to measure the audio increase for locating beats.
<b>xmpDM:useFileBeatsMarker</b>	Boolean	When true, the file beat markers are used for stretching. Otherwise the rise and duration fields are used to automatically locate the beats.

### 1.2.6.2 CuePointParam

A key-value pair describing a parameter of a cue-point [Marker](#).

**Table 13 — CuePointParam fields**

Name	Type	Description
<b>xmpDM:key</b>	Text	The key.
<b>xmpDM:value</b>	Text	The value.

### 1.2.6.3 FrameCount

A number of frames at a given frame rate, which specifies an audio or video time value for a [Marker](#) (as the value of [xmpDM:duration](#) or [xmpDM:startTime](#)). Can also be used in the time portion of a document [Part](#).

The frame-count value can include the frame rate as shown. For a [Marker](#) within a [Track](#), the frame rate can be specified separately in the [xmpDM:frameRate](#) of the [Track](#).

The string value is in one of these formats:

**Table 14 — FrameCount values**

"##"	<p>For a <a href="#">Marker</a> that is not in a <a href="#">Track</a>, a simple integer value is interpreted as a number of seconds, at the default frame rate of 1 fps.</p> <p>For <a href="#">Markers</a> within a <a href="#">Track</a>, an integer value is interpreted as ticks/frames in the timescale specified by the track's <a href="#">xmpDM:frameRate</a>.</p> <p>When the count is zero, no frame rate should be specified.</p>
------	---

**Table 14 — FrameCount values (Continued)**

"##f###" "##f###s###"	<p>A number of frames specified together with a <a href="#">FrameRate</a>, which can contain an optional rate basis. The rate basis defaults to 1.</p> <p>These examples show how a FrameCount value of 15 is expressed for common video and audio frame rates:</p> <ul style="list-style-type: none"> <li>Film at 24 fps (frame rate = 24, rate basis = 1): "15f24"</li> <li>Speech-to-text in milliseconds (frame rate = 1000, rate basis = 1): "15f1000"</li> <li>NTSC at 29.97 fps (frame rate = 30000, rate basis = 1001): "15f30000s1001"</li> <li>DVATicks (frame rate = 254016000000, rate basis = 1): "15f254016000000"</li> </ul>
"maximum"	<p>Allowed for a duration value; indicates that the time span is unlimited, or is determined automatically up to the full duration of the source.</p>

#### 1.2.6.4 FrameRate

A frame-rate value can be part of the [FrameCount](#) specification of a [Marker](#). For a [Marker](#) within a [Track](#), however, the frame count can be a simple integer, and the associated frame rate is specified separately, in the [xmpDM:frameRate](#) of the [Track](#).

A frame rate is expressed as a number of frames divided by a number of seconds (f/s). The number of seconds is called the *rate basis*; it defaults to 1, for the common frames-per-second (fps) expression. If no frame rate is specified in either the frame count itself or in the associated track, the frame count is also the number of seconds, at the default rate of 1 fps.

The string value is in one of these formats:

**Table 15 — FrameRate values**

"f###"	<p>The frame rate in frames-per-second (fps). The rate basis is assumed to be 1.</p> <p>For example, a frame rate of 24fps is specified as "f24".</p>
"f###s###"	<p>Specifies a frame rate with a rate basis. The second number is the rate basis, a number of seconds.</p> <p>For example, the NTSC 29.97 frame rate is specified as "f30000s1001".</p>

#### 1.2.6.5 Marker

A marker type used to describe an important location in an audio or video sequence. It is a value of the [xmpDM:markers](#) array in a [Track](#).

**Table 16 — Marker fields**

Name	Type	Description
<b>xmpDM:comment</b>	Text	Optional. A descriptive comment.
<b>xmpDM:cuePointParams</b>	ordered array of <a href="#">CuePointParam</a>	Optional. An ordered sequence of processing parameters for an FLVCuePoint-type marker.
<b>xmpDM:cuePointType</b>	Text	Optional. The cue-point type for an FLVCuePoint-type marker, one of Navigation or Event.

**Table 16 — Marker fields (Continued)**

Name	Type	Description
<b>xmpDM:duration</b>	<a href="#">FrameCount</a>	Optional. The duration of the marker. Default is 0. This is a number of ticks/frames in the timescale specified by an optionally included frame rate. If the parent <a href="#">Track</a> specifies <a href="#">xmpDM:frameRate</a> , that becomes the default frame rate for all member markers.  If no frame rate is specified in either the marker or the track, this value is a number of seconds (frames at the default frame rate of 1fps).
<b>xmpDM:location</b>	URI	Optional. The URL of the location to jump to, for a WebLink-type marker. For example, http://www.mysite.com.
<b>xmpDM:name</b>	Text	The name of the marker. For timed text, the phrase, word, or syllable.
<b>xmpDM:probability</b>	Real	Optional. For auto-detected speech, the probability that the word is accurate.
<b>xmpDM:speaker</b>	Text	Optional. The name or other identifier of the speaker or performer, for a Speech-type marker. The speaker need only be identified if it changes from the previous phrase.
<b>xmpDM:startTime</b>	<a href="#">FrameCount</a>	The timeline position of the marker. Default is 0, the beginning of the file that contains the track.
<b>xmpDM:target</b>	Text	Optional. A frame target, for a WebLink-type marker.
<b>xmpDM:type</b>	Open Choice of Text, comma-delimited list	Optional. A comma-delimited list of marker types. The type indicates how a marker or set of markers is intended to be used, and what other information is associated with it. Predefined value types include: Chapter Cue Index Speech Track  This type overrides any type specified in the containing <a href="#">Track</a> .

#### 1.2.6.6 Media

A reference to a media asset. This is typically a local file, but can be anything that can be specified with a URL. Contains information about usage in the parent media (typically a sequence), and the associated media rights.

**Table 17 — Media fields**

Name	Type	Description
<b>xmpDM:duration</b>	<a href="#">Time</a>	The duration of the asset in the timeline.
<b>xmpDM:managed</b>	Boolean	When true, this is a rights-managed resource.
<b>xmpDM:path</b>	URI	The location of the asset.

**Table 17 — Media fields (Continued)**

Name	Type	Description
<b>xmpDM:startTime</b>	Time	The timeline position of the start of the asset, an offset from the beginning of the file that contains the track.
<b>xmpDM:track</b>	Text	An identifier for the track that contained this asset. Could be a track name or a number.
<b>xmpDM:webStatement</b>	URI	The location of a web page describing the owner and/or rights statement for this resource.

**1.2.6.7 ProjectLink**

The type of a video file and path of the project that created it.

**Table 18 — ProjectLink fields**

Name	Type	Description
<b>xmpDM:path</b>	URI	Full path to the project that created this file.
<b>xmpDM:type</b>	Closed Choice of Text	The file type. One of: movie still audio custom

**1.2.6.8 resampleStretch**

A set of parameters used when stretching audio using the Resample stretch mode.

**Table 19 — resampleStretch fields**

Name	Type	Description
<b>xmpDM:quality</b>	Closed Choice of Text	One of: High Medium Low

**1.2.6.9 Time**

A representation of a time value in seconds. This is similar to After Effect's TDB, or QuickTime's representation of time. They each have a value, and the scale of the value. For example, if the scale is the rational 1/25 (PAL 25fps), and the value is 50, the time is 2 seconds.

**Table 20 — Time fields**

Name	Type	Description
<b>xmpDM:scale</b>	Rational	The scale for the time value. <ul style="list-style-type: none"> <li>For NTSC, use 1001/30000, or the less accurate 100/2997.</li> <li>For PAL, use 1/25.</li> </ul>
<b>xmpDM:value</b>	Integer	The time value in the specified scale.

### 1.2.6.10 Timecode

A timecode value in video.

Table 21 — Timecode fields

Name	Type	Description
<b>xmpDM:timeFormat</b>	Closed Choice of Text	The format used in the timeValue. One of: 24Timecode 25Timecode 2997DropTimecode ( <i>semicolon delimiter</i> ) 2997NonDropTimecode 30Timecode 50Timecode 5994DropTimecode ( <i>semicolon delimiter</i> ) 5994NonDropTimecode 60Timecode 23976Timecode
<b>xmpDM:timeValue</b>	Text	A time value in the specified format. Time values use a colon delimiter in all formats except 2997drop and 5994drop, which uses a semicolon. The four fields indicate hours, minutes, seconds, and frames: <i>hh:mm:ss:ff</i> The actual duration in seconds depends on the format.

### 1.2.6.11 timeScaleStretch

A set of parameters used when stretching audio using the Time-Scale stretch mode.

Table 22 — timeScaleStretch fields

Name	Type	Description
<b>xmpDM:frameOverlappingPercentage</b>	Real	The percentage of overlap between frames.
<b>xmpDM:frameSize</b>	Real	The splices per beat.
<b>xmpDM:quality</b>	Closed Choice of Text	One of: High Medium Low

### 1.2.6.12 Track

A named set of [Markers](#), that can specify different default time-frame rates from those of the contained markers.

Table 23 — Track fields

<b>xmpDM:frameRate</b>	<a href="#">FrameRate</a>	The default frame rate for the markers in the track.
<b>xmpDM:markers</b>	ordered array of <a href="#">Marker</a>	An ordered list of markers.
<b>xmpDM:trackName</b>	Text	The name of the track. (For example: Lyrics, Speech, Voiceover, Audition Conditions, and so on.)

**Table 23 — Track fields (Continued)**

<b>xmpDM:trackType</b>	Open Choice of Text, comma-delimited list	The default marker types for all markers in the track. See <a href="#">Marker</a> field <b>xmpDM:type</b> .
------------------------	---	---

## 1.3 Extensibility of namespaces

This section discusses how to create new namespaces and extend existing ones.

### 1.3.1 Creating custom namespaces

The namespaces defined in this document are core namespaces that are believed to be applicable to a wide variety of needs. If possible, it is always desirable to use properties from existing namespaces. However, XMP was designed to be easily extensible by the addition of custom namespaces. If your metadata needs are not already covered by the core namespaces, you can define and use your own namespaces.

If you are considering creating a new namespace, observe the following:

- Avoid including properties that have the same semantics as properties in existing namespaces.
- If your properties might be useful to others, try to collaborate in creating a common namespace, to avoid having a multitude of incompatible ones.

To define a new namespace, you should write a human-readable namespace specification document. The specification document should be made available to any developers who need to write code that understands your metadata. (Future versions of XMP might include support for machine-readable namespace specifications, but such support will always be in addition to the requirement for human-readable namespace specification documents.)

Your specification document should include:

- A unique name for your namespace in the form of a URI and a preferred prefix.
- A table containing the name of each property, the value type, and the description of the property. If you define properties that have structured value types, you may wish to use additional URI names to identify the components of a structured property value.

You can then add more properties as needed, following the RDF and XMP syntax requirements described in this document to create compatible RDF metadata.

### 1.3.2 Extending namespaces

Keep in mind the following points when extending a namespace:

- New properties can be added to existing namespaces without causing problems for applications.
- The definitions of properties in existing namespaces should always remain the same; otherwise, applications can produce incorrect behavior. If it is necessary to change the meaning of a property, a new property should be created, and the old one declared as deprecated.
- It is possible to create a “new version” of a namespace; however, there is no logical connection between the old version and the new version. The same local name in two different XML namespaces refers to two different properties.

## 2 XMP standard namespaces

This chapter contains the following information namespace definitions for standard namespaces.

The following namespaces definitions are included here:

- [2.1, “XMP namespace”](#)
- [2.2, “XMP Media Management namespace”](#)
- [2.3, “XMP Basic Job Ticket namespace”](#)
- [2.4, “XMP Paged-text namespace”](#)
- [2.5, “XMP Dynamic Media namespace”](#)

### 2.1 XMP namespace

The XMP basic namespace contains properties that provide basic descriptive information.

- The namespace URI is <http://ns.adobe.com/xap/1.0/>
- The preferred namespace prefix is xmp

**Table 24 — Properties in the XMP namespace**

Name	Type	Description
<b>xmp:Advisory</b> ( <i>deprecated</i> )	unordered array of XPath	An unordered array specifying properties that were edited outside the authoring application. Each item should contain a single namespace and XPath separated by one ASCII space (U+0020).
<b>xmp:BaseURL</b>	URL	The base URL for relative URLs in the document content. If this document contains Internet links, and those links are relative, they are relative to this base URL. This property provides a standard way for embedded relative URLs to be interpreted by tools. Web authoring tools should set the value based on their notion of where URLs will be interpreted.
<b>xmp:CreateDate</b>	Date	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:CreatorTool</b>	AgentName	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:Identifier</b>	unordered array of Text	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:Label</b>	Text	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:MetadataDate</b>	Date	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:ModifyDate</b>	Date	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmp:Nickname</b>	Text	A short informal name for the resource.
<b>xmp:Rating</b>	Closed Choice of Real	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.

**Table 24 — Properties in the XMP namespace (Continued)**

Name	Type	Description
<b>xmp:Thumbnails</b>	alternative array of <a href="#">Thumbnail</a>	An alternative array of thumbnail images for a file, which can differ in characteristics such as size or image encoding.

## 2.2 XMP Media Management namespace

This namespace is primarily for use by digital asset management (DAM) systems.

The following properties are “owned” by the DAM system and should be set by applications under their direction; they should not be used by unmanaged files: [xmpMM: ManagedFrom](#), [xmpMM: Manager](#), [xmpMM: ManageTo](#), [xmpMM: ManageUI](#), [xmpMM: ManagerVariant](#).

The following properties are owned by the DAM system for managed files, but can also be used by applications for unmanaged files: [xmpMM: DerivedFrom](#), [xmpMM: DocumentID](#), [xmpMM: RenditionClass](#), [xmpMM: RenditionParams](#), [xmpMM: VersionID](#), [xmpMM: Versions](#).

The [xmpMM: History](#) property is always owned by the application.

- The namespace URI is <http://ns.adobe.com/xap/1.0/mm/>
- The preferred namespace prefix is xmpMM

**Table 25 — XMP Media Management properties**

Name	Type	Description
<b>xmpMM:DerivedFrom</b>	<a href="#">ResourceRef</a>	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM:DocumentID</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM:History</b>	ordered array of <a href="#">ResourceEvent</a>	High-level actions that resulted in this resource. It is intended to give human readers a description of the steps taken to make the changes from the previous version to this one. The list should be at an abstract level; it is not intended to be an exhaustive keystroke or other detailed history. The description should be sufficient for metadata management, as well as for workflow enhancement.
<b>xmpMM:Ingredients</b>	unordered array of <a href="#">ResourceRef</a>	References to resources that were incorporated, by inclusion or reference, into this resource.
<b>xmpMM:InstanceID</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM: ManagedFrom</b>	<a href="#">ResourceRef</a>	A reference to the document as it was prior to becoming managed. It is set when a managed document is introduced to an asset management system that does not currently own it. It may or may not include references to different management systems.
<b>xmpMM: Manager</b>	AgentName	The name of the asset management system that manages this resource. Along with <a href="#">xmpMM: ManagerVariant</a> , it tells applications which asset management system to contact concerning this document.

Table 25 — XMP Media Management properties (Continued)

Name	Type	Description
<b>xmpMM:ManageTo</b>	URI	A URI identifying the managed resource to the asset management system; the presence of this property is the formal indication that this resource is managed. The form and content of this URI is private to the asset management system.
<b>xmpMM:ManageUI</b>	URI	A URI that can be used to access information about the managed resource through a web browser. It might require a custom browser plug-in.
<b>xmpMM:ManagerVariant</b>	Text	Specifies a particular variant of the asset management system. The format of this property is private to the specific asset management system.
<b>xmpMM:OriginalDocumentID</b>	URI	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM:Pantry</b>	unordered array of struct	Each array item has a structure value with a potentially unique set of fields, containing extracted XMP from a component. Each field is a property from the XMP of a contained resource component, with all substructure preserved.  Each pantry entry shall contain an <b>xmpMM:InstanceID</b> . Only one copy of the pantry entry for any given <b>xmpMM:InstanceID</b> shall be retained in the pantry.  Nested pantry items shall be removed from the individual pantry item and promoted to the top level of the pantry.
<b>xmpMM:RenditionClass</b>	RenditionClass	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM:RenditionParams</b>	Text	Refer to <i>Part 1, Data Model, Serialization, and Core Properties</i> , for definition.
<b>xmpMM:VersionID</b>	Text	The document version identifier for this resource.  Each version of a document gets a new identifier, usually simply by incrementing integers 1, 2, 3 . . . and so on. Media management systems can have other conventions or support branching which requires a more complex scheme.
<b>xmpMM:Versions</b>	ordered array of <a href="#">Version</a>	The version history associated with this resource. Entry [1] is the oldest known version for this document, entry [last()] is the most recent version.  Typically, a media management system would fill in the version information in the metadata on check-in.  It is not guaranteed that a complete history of versions from the first to this one will be present in the xmpMM:Versions property. Interior version information can be compressed or eliminated and the version history can be truncated at some point.

Table 26 — Deprecated Media Management properties

<del><b>xmpMM:LastURL</b></del> (deprecated)	URL	Deprecated for privacy protection.
---	-----	------------------------------------

**Table 26 — Deprecated Media Management properties (Continued)**

<b>xmpMM:RenditionOf</b> ( <i>deprecated</i> )	<a href="#">ResourceRef</a>	Deprecated in favour of <a href="#">xmpMM:DerivedFrom</a> . A reference to the document of which this is a rendition.
<b>xmpMM:SaveID</b> ( <i>deprecated</i> )	Integer	Deprecated. Previously used only to support the xmpMM:LastURL property.

## 2.3 XMP Basic Job Ticket namespace

This namespace describes very simple workflow or job information.

- The namespace URI is <http://ns.adobe.com/xap/1.0/bj/>
- The preferred namespace prefix is xmpBJ

**Table 27 — Basic Job Ticket properties**

Name	Type	Description
<b>xmpBJ:JobRef</b>	unordered array of <a href="#">Job</a>	References an external job management file for a job process in which the document is being used. Use of job names is under user control. Typical use would be to identify all documents that are part of a particular job or contract.  There are multiple values because there can be more than one job using a particular document at any time, and it can also be useful to keep historical information about what jobs a document was part of previously.

## 2.4 XMP Paged-text namespace

This namespace is used for text appearing on a page in a document.

- The namespace URI is <http://ns.adobe.com/xap/1.0/t/pg/>
- The preferred namespace prefix is xmpTPg

**Table 28 — Paged-text properties**

Name	Type	Description
<b>xmpTPg:Colorants</b>	ordered array of Colorants	An ordered array of colorants (swatches) that are used in the document (including any in contained documents).
<b>xmpTPg:Fonts</b>	unordered array of <a href="#">Font</a>	An unordered array of fonts that are used in the document (including any in contained documents).
<b>xmpTPg:MaxPageSize</b>	<a href="#">Dimensions</a>	The size of the largest page in the document (including any in contained documents).
<b>xmpTPg:NPages</b>	Integer	The number of pages in the document (including any in contained documents).
<b>xmpTPg:PlateNames</b>	ordered array of Text	An ordered array of plate names that are needed to print the document (including any in contained documents).

## 2.5 XMP Dynamic Media namespace

This namespace specifies properties used by the Adobe dynamic media group.

- The namespace URI is <http://ns.adobe.com/xmp/1.0/DynamicMedia/>
- The preferred namespace prefix is xmpDM

**Table 29 — XMP Dynamic Media properties**

Name	Type	Description
<b>xmpDM:absPeakAudioFilePath</b>	URI	The absolute path to the file's peak audio file. If empty, no peak file exists.
<b>xmpDM:album</b>	Text	The name of the album.
<b>xmpDM:altTapeName</b>	Text	An alternative tape name, set via the project window or timecode dialog in Premiere. If an alternative name has been set and has not been reverted, that name is displayed.
<b>xmpDM:altTimecode</b>	<a href="#">Timecode</a>	A timecode set by the user. When specified, it is used instead of the startTimecode.
<b>xmpDM:artist</b>	Text	The name of the artist or artists.
<b><del>xmpDM:audioModDate</del> (deprecated)</b>	Date	The date and time when the audio was last modified.
<b>xmpDM:audioChannelType</b>	closed Choice of Text	The audio channel type. One of: Mono Stereo 5.1 7.1 16 Channel Other
<b>xmpDM:audioCompressor</b>	Text	The audio compression used. For example, MP3.
<b>xmpDM:audioSampleRate</b>	Integer	The audio sample rate. Can be any value, but commonly 32000, 44100, or 48000.
<b>xmpDM:audioSampleType</b>	closed Choice of Text	The audio sample type. One of: 8Int 16Int 24Int 32Int 32Float Compressed Packed Other
<b>xmpDM:beatSpliceParams</b>	<a href="#">beatSpliceStretch</a>	Additional parameters for Beat Splice stretch mode.

Table 29 — XMP Dynamic Media properties (Continued)

Name	Type	Description
<b>xmpDM:cameraAngle</b>	open Choice of Text	The orientation of the camera to the subject in a static shot, from a fixed set of industry standard terminology. Predefined values include: Low Angle Eye Level High Angle Overhead Shot Birds Eye Shot Dutch Angle POV Over the Shoulder Reaction Shot
<b>xmpDM:cameraLabel</b>	Text	A description of the camera used for a shoot. Can be any string, but is usually simply a number, for example "1", "2", or more explicitly "Camera 1".
<b>xmpDM:cameraModel</b>	Text	The make and model of the camera used for a shoot.
<b>xmpDM:cameraMove</b>	open Choice of Text	The movement of the camera during the shot, from a fixed set of industry standard terminology. Predefined values include: Aerial Boom Up Boom Down Crane Up Crane Down Dolly In Dolly Out Pan Left Pan Right Pedestal Up Pedestal Down Tilt Up Tilt Down Tracking Truck Left Truck Right Zoom In Zoom Out
<b>xmpDM:client</b>	Text	The client for the job of which this shot or take is a part.
<b>xmpDM:comment</b>	Text	A user's comments.
<b>xmpDM:composer</b>	Text	The composer's names.
<b>xmpDM:contributedMedia</b>	unordered array of <a href="#">Media</a>	An unordered list of all media used to create this media.
<del><b>xmpDM:copyright</b></del> <b>(deprecated)</b>	Text	Deprecated in favour of <b>dc:rights</b> .
<b>xmpDM:director</b>	Text	The director of the scene.

Table 29 — XMP Dynamic Media properties (Continued)

Name	Type	Description
<b>xmpDM:directorPhotography</b>	Text	The director of photography for the scene.
<b>xmpDM:duration</b>	<a href="#">Time</a>	The duration of the media file.
<b>xmpDM:engineer</b>	Text	The engineer's names.
<b>xmpDM:fileDataRate</b>	Rational	The file data rate in megabytes per second. For example: "36/10" = 3.6 MB/sec
<b>xmpDM:genre</b>	Text	The name of the genres.
<b>xmpDM:good</b>	Boolean	A checkbox for tracking whether a shot is a keeper.
<b>xmpDM:instrument</b>	Text	The musical instruments.
<b>xmpDM:introTime</b>	<a href="#">Time</a>	The duration of lead time for queuing music.
<b>xmpDM:key</b>	closed Choice of Text	The audio's musical key. One of: C C# D D# E F F# G G# A A# B
<b>xmpDM:logComment</b>	Text	User's log comments.
<b>xmpDM:loop</b>	Boolean	When true, the clip can be looped seamlessly.
<b>xmpDM:numberOfBeats</b>	Real	The total number of musical beats in a clip; for example, the beats-per-second times the duration in seconds.
<b>xmpDM:markers</b>	ordered array of <a href="#">Marker</a>	An ordered list of markers. See also <a href="#">xmpDM:Tracks</a> .
<del><b>xmpDM:metadataModDate</b></del> <b>(deprecated)</b>	Date	The date and time when the metadata was last modified.
<b>xmpDM:outCue</b>	<a href="#">Time</a>	The time at which to fade out.
<b>xmpDM:projectName</b>	Text	The name of the project of which this file is a part.
<b>xmpDM:projectRef</b>	<a href="#">ProjectLink</a>	A reference to the project of which this file is a part.

**Table 29 — XMP Dynamic Media properties (Continued)**

Name	Type	Description
<b>xmpDM:pullDown</b>	closed Choice of Text	The sampling phase of film to be converted to video (pull-down). One of: WSSWW SSWWW SWWWs WWWSS WWSSW WWWSW WWSWW WSWWW SWWWW WWWWs
<b>xmpDM:relativePeakAudioFilePath</b>	URI	The relative path to the file's peak audio file. If empty, no peak file exists.
<b>xmpDM:relativeTimestamp</b>	<a href="#">Time</a>	The start time of the media inside the audio project.
<b>xmpDM:releaseDate</b>	Date	The date the title was released.
<b>xmpDM:resampleParams</b>	<a href="#">resampleStretch</a>	Additional parameters for Resample stretch mode.
<b>xmpDM:scaleType</b>	closed Choice of Text	The musical scale used in the music. One of: Major Minor Both Neither Neither is most often used for instruments with no associated scale, such as drums.
<b>xmpDM:scene</b>	Text	The name or number of the scene.
<b>xmpDM:shotDate</b>	Date	The date and time when the video was shot.
<b>xmpDM:shotDay</b>	Text	The day in a multiday shoot. For example: "Day 2", "Friday".
<b>xmpDM:shotLocation</b>	Text	The name of the location where the video was shot. For example: "Oktoberfest, Munich Germany" For more accurate positioning, use the Exif GPS values.
<b>xmpDM:shotName</b>	Text	The name of the shot or take.
<b>xmpDM:shotNumber</b>	Text	The position of the shot in a script or production, relative to other shots. For example: 1, 2, 1a, 1b, 1.1, 1.2.

**Table 29 — XMP Dynamic Media properties (Continued)**

Name	Type	Description
<b>xmpDM:shotSize</b>	open Choice of Text	The size or scale of the shot framing, from a fixed set of industry standard terminology. Predefined values include: ECU --extreme close-up MCU -- medium close-up CU -- close-up MS -- medium shot WS -- wide shot MWS -- medium wide shot EWS -- extreme wide shot
<b>xmpDM:speakerPlacement</b>	Text	A description of the speaker angles from centre front in degrees. For example: "Left = -30, Right = 30, Centre = 0, LFE = 45, Left Surround = -110, Right Surround = 110"
<b>xmpDM:startTimecode</b>	<a href="#">Timecode</a>	The timecode of the first frame of video in the file, as obtained from the device control.
<b>xmpDM:stretchMode</b>	closed Choice of Text	The audio stretch mode. One of: Fixed length Time-Scale Resample Beat Splice Hybrid
<b>xmpDM:takeNumber</b>	Integer	A numeric value indicating the absolute number of a take.
<b>xmpDM:tapeName</b>	Text	The name of the tape from which the clip was captured, as set during the capture process.
<b>xmpDM:tempo</b>	Real	The audio's tempo.
<b>xmpDM:timeScaleParams</b>	<a href="#">timeScaleStretch</a>	Additional parameters for Time-Scale stretch mode.
<b>xmpDM:timeSignature</b>	closed Choice of Text	The time signature of the music. One of: 2/4 3/4 4/4 5/4 7/4 6/8 9/8 12/8 other
<b>xmpDM:trackNumber</b>	Integer	A numeric value indicating the order of the audio file within its original recording.
<b>xmpDM:Tracks</b>	unordered array of <a href="#">Track</a>	An unordered list of tracks. A track is a named set of markers, which can specify a frame rate for all markers in the set. See also <a href="#">xmpDM:markers</a> .

Table 29 — XMP Dynamic Media properties (Continued)

Name	Type	Description
<b>xmpDM:videoAlphaMode</b>	closed Choice of Text	The alpha mode. One of: straight pre-multiplied none
<b>xmpDM:videoAlphaPremultipleColor</b>	Colorant	A colour in CMYK or RGB to be used as the premultiple colour when alpha mode is premultiplied.
<b>xmpDM:videoAlphaUnityIsTransparent</b>	Boolean	When true, unity is clear, when false, it is opaque.
<b>xmpDM:videoColorSpace</b>	closed Choice of Text	The colour space. One of: sRGB (used by Photoshop) CCIR-601 (used for NTSC) CCIR-709 (used for HD)
<b>xmpDM:videoCompressor</b>	Text	Video compression used. For example, jpeg.
<b>xmpDM:videoFieldOrder</b>	closed Choice of Text	The field order for video. One of: Upper Lower Progressive
<b>xmpDM:videoFrameRate</b>	Real	The video frame rate. Predefined values include: 24 NTSC PAL
<b>xmpDM:videoFrameSize</b>	<a href="#">Dimensions</a>	The frame size. For example: w:720, h: 480, unit:pixels
<b>xmpDM:videoModDate</b> <i>(deprecated)</i>	Date	The date and time when the video was last modified.
<b>xmpDM:videoPixelDepth</b>	closed Choice of Text	The size in bits of each colour component of a pixel. Standard Windows 32-bit pixels have 8 bits per component. One of: 8Int 16Int 24Int 32Int 32Float Other
<b>xmpDM:videoPixelAspectRatio</b>	Rational	The aspect ratio, expressed as wd/ht. For example: "648/720" = 0.9
<b>xmpDM:partOfCompilation</b>	Boolean	Part of compilation.
<b>xmpDM:lyrics</b>	Text	Lyrics text. No association with timecode.
<b>xmpDM:discNumber</b>	Text	If in a multi-disc set, might contain total number of discs. For example: 2/3.

## 3 Specialized Namespaces

This chapter contains namespace definitions for namespaces that are specialized for Adobe applications and usages. The following namespace definitions are included here:

- [3.1, “Adobe PDF namespace”](#)
- [3.2, “Photoshop namespace”](#)
- [3.3, “Camera Raw namespace”](#)
- [3.4, “Exif namespaces”](#)

### 3.1 Adobe PDF namespace

This namespace specifies properties used with Adobe PDF documents.

- The namespace URI is <http://ns.adobe.com/pdf/1.3/>
- The preferred namespace prefix is pdf

**Table 30 — PDF properties**

Name	Type	Description
<b>pdf:Keywords</b>	Text	Keywords.
<b>pdf:PDFVersion</b>	Text	The PDF file version (for example: 1.0, 1.3, and so on).
<b>pdf:Producer</b>	AgentName	The name of the tool that created the PDF document.
<b>pdf:Trapped</b>	Boolean	True when the document has been trapped.

### 3.2 Photoshop namespace

This namespace specifies properties used by Adobe Photoshop.

- The namespace URI is <http://ns.adobe.com/photoshop/1.0/>
- The preferred namespace prefix is photoshop

#### 3.2.1 Types

These types are defined in the Photoshop namespace for use by the Photoshop metadata:

##### 3.2.1.1 Ancestor

A structure identifying a document that was copied or placed into the current document.

**Table 31 — Ancestor fields**

Name	Type	Description
<b>photoshop:AncestorID</b>	URI	The unique identifier of a document.

### 3.2.1.2 Layer

A structure associating an identifying name and text content with a text layer of a Photoshop document.

**Table 32 — Layer fields**

Name	Type	Description
<b>photoshop:LayerName</b>	Text	The identifying name of the text layer.
<b>photoshop:LayerText</b>	Text	The text content of the text layer.

### 3.2.2 Properties

**Table 33 — Photoshop properties**

Name	Type	Description
<b>photoshop:AuthorsPosition</b>	Text	By-line title.
<b>photoshop:CaptionWriter</b>	ProperName	Writer/editor.
<b>photoshop:Category</b>	Text	Category. Limited to 3 7-bit ASCII characters.
<b>photoshop:City</b>	Text	City.
<b>photoshop:ColorMode</b>	Closed Choice of Integer	The colour mode. One of: 0 = Bitmap 1 = Gray scale 2 = Indexed colour 3 = RGB colour 4 = CMYK colour 7 = Multi-channel 8 = Duotone 9 = LAB colour
<b>photoshop:Country</b>	Text	Country/primary location.
<b>photoshop:Credit</b>	Text	Credit.
<b>photoshop:DateCreated</b>	Date	The date the intellectual content of the document was created, rather than the creation date of the physical representation.
<b>photoshop:DocumentAncestors</b>	unordered array of <a href="#">Ancestor</a>	If the source document for a copy-and-paste or place operation has a document ID, that ID is added to this list in the destination document's XMP.
<b>photoshop:Headline</b>	Text	Headline.
<b>photoshop:History</b>	Text	The history that appears in the FileInfo panel, if activated in the application preferences.
<b>photoshop:ICCPProfile</b>	Text	The colour profile, such as AppleRGB, AdobeRGB1998.
<b>photoshop:Instructions</b>	Text	Special instructions.
<b>photoshop:Source</b>	Text	Source.
<b>photoshop:State</b>	Text	Province/state.

**Table 33 — Photoshop properties (Continued)**

Name	Type	Description
<b>photoshop:SupplementalCategories</b>	unordered array of Text	Supplemental category.
<b>photoshop:TextLayers</b>	ordered array of <a href="#">Layer</a>	If a document has text layers, this property caches the text for each layer.
<b>photoshop:TransmissionReference</b>	Text	Original transmission reference.
<b>photoshop:Urgency</b>	Integer	Urgency. Valid range is 1-8.

### 3.3 Camera Raw namespace

This namespace specifies settings associated with image files produced in camera raw mode.

- The namespace URI is <http://ns.adobe.com/camera-raw-settings/1.0/>
- The preferred namespace prefix is `crs`

**Table 34 — Camera Raw properties**

Name	Type	Description
<b>crs:AutoBrightness</b>	Boolean	When true, "Brightness" is automatically adjusted.
<b>crs:AutoContrast</b>	Boolean	When true, "Contrast" is automatically adjusted.
<b>crs:AutoExposure</b>	Boolean	When true, "Exposure" is automatically adjusted.
<b>crs:AutoShadows</b>	Boolean	When true, "Shadows" is automatically adjusted.
<b>crs:BlueHue</b>	Integer	"Blue Hue" setting. Range -100 to 100.
<b>crs:BlueSaturation</b>	Integer	"Blue Saturation" setting. Range -100 to 100.
<b>crs:Brightness</b>	Integer	"Brightness" setting. Range 0 to 150.
<b>crs:CameraProfile</b>	Text	"Camera Profile" setting.
<b>crs:ChromaticAberrationB</b>	Integer	"Chromatic Aberration, Fix Blue/Yellow Fringe" setting. Range -100 to 100.
<b>crs:ChromaticAberrationR</b>	Integer	"Chromatic Aberration, Fix Red/Cyan Fringe" setting. Range -100 to 100.
<b>crs:ColorNoiseReduction</b>	Integer	"Color Noise Reduction" setting. Range 0 to 100.
<b>crs:Contrast</b>	Integer	"Contrast" setting. Range -50 to 100.
<b>crs:CropTop</b>	Real	When HasCrop is true, top of crop rectangle
<b>crs:CropLeft</b>	Real	When HasCrop is true, left of crop rectangle.
<b>crs:CropBottom</b>	Real	When HasCrop is true, bottom of crop rectangle.
<b>crs:CropRight</b>	Real	When HasCrop is true, right of crop rectangle.
<b>crs:CropAngle</b>	Real	When HasCrop is true, angle of crop rectangle.

**Table 34 — Camera Raw properties (Continued)**

Name	Type	Description
<b>crs:CropWidth</b>	Real	Width of resulting cropped image in CropUnits units.
<b>crs:CropHeight</b>	Real	Height of resulting cropped image in CropUnits units.
<b>crs:CropUnits</b>	Integer	Units for CropWidth and CropHeight. One of: 0 = pixels 1 = inches 2 = cm
<b>crs:Exposure</b>	Real	"Exposure" setting. Range -4.0 to 4.0.
<b>crs:GreenHue</b>	Integer	"Green Hue" setting. Range -100 to 100.
<b>crs:GreenSaturation</b>	Integer	"Green Saturation" setting. Range -100 to 100.
<b>crs:HasCrop</b>	Boolean	When true, image has a cropping rectangle.
<b>crs:HasSettings</b>	Boolean	When true, nondefault camera raw settings.
<b>crs:LuminanceSmoothing</b>	Integer	"Luminance Smoothing" setting. Range 0 to 100.
<b>crs:RawFileName</b>	Text	File name for raw file (not a complete path).
<b>crs:RedHue</b>	Integer	"Red Hue" setting. Range -100 to 100.
<b>crs:RedSaturation</b>	Integer	"Red Saturation" setting. Range -100 to 100.
<b>crs:Saturation</b>	Integer	"Saturation" setting. Range -100 to 100.
<b>crs:Shadows</b>	Integer	"Shadows" setting. Range 0 to 100.
<b>crs:ShadowTint</b>	Integer	"Shadow Tint" setting. Range -100 to 100.
<b>crs:Sharpness</b>	Integer	"Sharpness" setting. Range 0 to 100.
<b>crs:Temperature</b>	Integer	"Temperature" setting. Range 2000 to 50000.
<b>crs:Tint</b>	Integer	"Tint" setting. Range -150 to 150.
<b>crs:ToneCurve</b>	ordered array of points (Integer, Integer)	Array of points (Integer, Integer) defining a "Tone Curve."
<b>crs:ToneCurveName</b>	Choice of Text	The name of the Tone Curve described by ToneCurve. One of: Linear Medium Contrast Strong Contrast Custom or a user-defined preset name
<b>crs:Version</b>	Text	Version of Camera Raw plug-in.
<b>crs:VignetteAmount</b>	Integer	"Vignetting Amount" setting. Range -100 to 100.
<b>crs:VignetteMidpoint</b>	Integer	"Vignetting Midpoint" setting. Range 0 to 100.

**Table 34 — Camera Raw properties (Continued)**

Name	Type	Description
<b>crs:WhiteBalance</b>	Closed Choice of Text	"White Balance" setting. One of: As Shot Auto Daylight Cloudy Shade Tungsten Fluorescent Flash Custom

### 3.4 Exif namespaces

Exif is a metadata standard for image files, used widely by digital cameras. The Exif specification is owned by the Japanese Camera & Imaging Products Association (CIPA).

- The Exif 2.3 specification can be found at [http://www.cipa.jp/english/hyoujunka/kikaku/pdf/DC-008-2010\\_E.pdf](http://www.cipa.jp/english/hyoujunka/kikaku/pdf/DC-008-2010_E.pdf)
- The mappings between Exif/TIFF tags and XMP are described in a document available from [http://www.cipa.jp/english/hyoujunka/kikaku/cipa\\_e\\_kikaku\\_list.html](http://www.cipa.jp/english/hyoujunka/kikaku/cipa_e_kikaku_list.html)

## 4 Authority over property values

This chapter describes value-assignment authority and identifies that authority for all XMP properties described in *Part 1, Data Model, Serialization, and Core Properties* and in *Part 2, Additional Properties*.

### 4.1 Overview

Top-level properties in XMP have a notion of authority over their values, expressed as being either an *internal* property or an *external* property. This is not a strict notion; rather, it is a general guideline to UI designers, application developers, and users about when and how property values are set. Each lower-level component of XMP (structure fields, array items, and qualifiers) inherits this notion from its top-level property.

The authority to set an external property generally belongs to a human. Examples include common descriptive metadata such as description, keywords, or copyright. External properties can be set by applications when importing information from other sources of metadata. For example, many file formats have a non-XMP manner in which to store a copyright. External properties can also be set by custom applications, which are often used to ensure that standard metadata exists.

The authority to set an internal property generally belongs to the device or application that creates the XMP. There are several common kinds of internal properties, roughly grouped by how they relate to the content associated with the XMP. The following list is not comprehensive, but is an illustration to help classify newly developed properties:

- Some internal properties are inherently related to the content and must change if the content is edited in various ways. Examples include a word or page count in a text document, pixel height and width in a still image, duration in a video file, or a modification timestamp. Allowing a user to edit these properties would result in incorrect metadata.
- Some internal properties contain private information that belongs to an application but that is not inherently tied to the content. Examples include nondestructive photo processing information such as exposure adjustments or workflow status information. Allowing a user to edit these properties would result in incorrect metadata.
- Some internal properties contain nonintrinsic metadata such as capture conditions or post-processing operations. Examples include lens and exposure information for a photograph or an automated speech transcript in a video. Allowing a user to edit these properties can be appropriate in some circumstances. A user might add lens information that a camera did not capture, correct a capture time because of improper camera settings, or correct errors in an automated speech transcript.

### 4.2 Dublin Core properties' internal/external state

Unless otherwise noted, all properties in the Dublin Core namespace are external.

Internal properties in Dublin Core:

- **dc:format**
- **dc:language**
- **dc:relation**

### 4.3 XMP Basic properties' internal/external state

Unless otherwise noted, all properties in the XMP Basic namespace are external.

Internal properties in XMP Basic:

- **xmp:BaseURL**
- **xmp:CreatorTool**

- **xmp:MetadataDate**
- **xmp:ModifyDate**
- **xmp:Thumbnails**

#### **4.4 XMP Rights Management properties' internal/external state**

All properties in the XMP Rights Management namespace are external.

#### **4.5 XMP Media Management properties' internal/external state**

All properties in the XMP Media Management namespace are internal.

#### **4.6 XMP Basic Job Ticket properties' internal/external state**

All properties in the XMP Basic Job Ticket namespace are external.

#### **4.7 XMP Paged-text properties' internal/external state**

All properties in the XMP Paged-text namespace are internal.

#### **4.8 XMP Dynamic Media properties' internal/external state**

Unless otherwise noted, all properties in the XMP Dynamic Media namespace are internal.

External properties in XMP Dynamic Media:

- **xmpDM:album**
- **xmpDM:altTapeName**
- **xmpDM:altTimecode**
- **xmpDM:artist**
- **xmpDM:cameraAngle**
- **xmpDM:cameraLabel**
- **xmpDM:cameraModel**
- **xmpDM:cameraMove**
- **xmpDM:client**
- **xmpDM:comment**
- **xmpDM:composer**
- **xmpDM:director**
- **xmpDM:directorPhotography**
- **xmpDM:engineer**
- **xmpDM:genre**
- **xmpDM:good**
- **xmpDM:instrument**
- **xmpDM:logComment**
- **xmpDM:projectName**
- **xmpDM:releaseDate**

- **xmpDM:scene**
- **xmpDM:shotDate**
- **xmpDM:shotDay**
- **xmpDM:shotLocation**
- **xmpDM:shotName**
- **xmpDM:shotNumber**
- **xmpDM:shotSize**
- **xmpDM:speakerPlacement**
- **xmpDM:takeNumber**
- **xmpDM:tapeName**
- **xmpDM:trackNumber**
- **xmpDM:videoAlphaMode**
- **xmpDM:videoAlphaPremultipleColor**
- **xmpDM:partOfCompilation**
- **xmpDM:lyrics**
- **xmpDM:discNumber**

#### **4.9 Adobe PDF properties' internal/external state**

Unless otherwise noted, all properties in the Adobe PDF namespace are external.

Internal properties in Adobe PDF:

- **pdf:PDFVersion**
- **pdf:Producer**

#### **4.10 Photoshop properties' internal/external state**

Unless otherwise noted, all properties in the Photoshop namespace are external.

Internal properties in Photoshop:

- **photoshop:ColorMode**
- **photoshop:ICCProfile**

#### **4.11 Camera Raw properties' internal/external state**

All properties in the Camera Raw namespace are internal.

#### **4.12 TIFF and Exif properties' internal/external state**

Unless otherwise noted, all properties in the TIFF and Exif namespaces are internal.

External properties in TIFF and Exif:

- **tiff:Artist**
- **tiff:Copyright**

- **tiff:ImageDescription**
- **exif:UserComment**
